Scouting Summary

COMMON THEMES

- Off Spin, averaging 85.5 kph (up to 93.4).
- Typical length is **4-5m** (their good length); median 4.2 m.
- Stock ball is **full on the stumps, turning away, drifting in, hitting the stumps** (31% of deliveries).
- Goes round the wicket 97% of the time against left-handers.
- Turns it 4.4° on average; 33% of balls turn ≥5°.
- Across an over he **repeats his length ball after ball**.

BIGGEST THREATS

- Most dangerous length is **Good Length** (4 wkts, 1.9% adjusted strike).
- Danger pitching line: **5th stump**.
- Takes 33% of wickets pitching **full on the stumps**.
- Beats the bat 4.2% of tracked balls (false-shot 10.5%).
- Gets you **bowled** more than most — 40% of his wickets (2.4× the typical rate for this type).
- 57% of catches are behind the wicket (keeper / slips / gully); most often to keeper, bowler, slip: 1st.
- Very repeatable with his length — using your feet to change his length is more effective than waiting for a loose ball.

AREAS TO EXPLOIT

- Concedes most runs pitching **full on the stumps** (23% of runs).
- Away from good length, the wicket threat drops off — look to score in the less-productive lengths.
- Most of his runs leak through the leg side (44%) — his main scoring release.
- Cash in when he goes **good length in the channel** (economy 4.9, beats the bat only 10%).

Bowling Fingerprint

Changing (last 3 years vs career): crease variation down; drift down; turn down.

Solid line = career, dotted = last 3 years (where enough recent balls). Percentile within same-type peers (grey = the peer distribution, line = this bowler). Release/crease vs hand × pace/spin; movement/speed/repeatability vs pace/spin. Release & speed are modern-era (2017+ / partial). **Crease variation** = how much he moves his release point sideways across the crease from ball to ball (within his main angle): a high percentile = he varies where he lets the ball go a lot, a low percentile = he releases from the same spot every ball. **Repeatability** = length consistency over his stock-length band (2–11 m, so deliberate yorkers and bouncers don't count as poor control): a high percentile = tighter, more metronomic lengths than peers; a low percentile = he varies his length more. A marker at the very edge = he sits beyond the typical peer range on that trait.

He's around his career level lately (avg 30 last 5 vs 29 career).

Window	Balls	Wkts	Avg	Econ	SR	False%	Avg speed	Avg length
Last 5 Tests	770	14	29.9	3.26	55.0	11%	87	4.65 m
Career	2,656	48	28.6	3.10	55.3	8%	85	4.60 m

How he gets you out	His %	Base	Index
Caught	47%	59%	0.79×
Bowled	40%	17%	2.37×
LBW	13%	20%	0.67×

Share of his 15 wickets by type, indexed against the base rate vs the average spin bowler to LHB (men's Tests). **Index** >1 = he does it more than most, <1 = less. Caught is high for everyone — the signal is the over-indexed row.

Catches to: [Keeper 2](#) [Bowler 1](#) [Slip: 1st 1](#) [Fine leg: short 1](#) [Slip: 2nd 1](#)
Angle & variations: Mostly over the wicket (round LHB 96% · RHB 19%)

Stock Ball & Ball Types (vs left-handers) [▶ watch stock balls](#)

Stock ball — full on the stumps, turning away, drifting in, hitting the stumps (31% of deliveries, economy 2.19). Minor variations: full in the channel (17%) and a good length outside off (12%).

Ball type (pitch length × pitching line)	Movement	%	Econ	Wkts	Beaten %
full on the stumps ▶	turning away, drifting in	31%	2.19	4	10%
full in the channel ▶	turning away, drifting in	17%	1.77	1	10%
a good length outside off ▶	turning away, drifting in	12%	4.19	2	9%
full outside off ▶	turning away, drifting in	12%	3.29	2	13%
full down the leg side ▶	turning away, drifting in	9%	3.05	1	10%
a good length in the channel ▶	turning away, drifting in	9%	4.94	1	10%

Ball type = pitch-length band × pitching-line region. **Movement** = swing in the air + seam/turn off the pitch, whichever is material, dominant first (ball-tracking, tracked balls only; blank if too few). **Beaten %** = false-shot rate on tracked balls. The stock-ball line above also notes where it passes the stumps.

New ball vs old ball

New ball (≤30 ov) · 377 balls · 5 wkts · econ 2.71

Top ball type	%	Econ	Wkts
full on the stumps	29%	2.44	2
full in the channel	18%	1.20	0
a good length outside off	14%	3.75	0
full outside off	12%	1.41	2

Old ball (31+ ov) · 530 balls · 10 wkts · econ 2.81

Top ball type	%	Econ	Wkts
full on the stumps	32%	2.03	2
full in the channel	16%	2.22	1
full down the leg side	12%	2.57	1
full outside off	12%	4.62	0

How his ball types and threat shift with ball age (split at 30 overs). Empty side = too few balls in that phase.

Danger Zones (vs left-handers) [▶ watch danger balls](#)

WICKETS — WHERE MOST CAME FROM
Full on the stumps
33% of mapped wickets (4 of 12)

RUNS — WHERE MOST CONCEDED
Full on the stumps
23% of runs (77 of 333)

DANGER LINE
5th stump
4 wkts / 126 balls · 2.6% adj (3.2% raw) · low sample

DANGER LENGTH
Good Length
4 wkts / 211 balls · 1.9% adj (1.9% raw) · low sample

MOST LETHAL ZONE (BY RATE)
Full / Stumps
4 wkts / 207 balls · 1.9% adj (1.9% raw) · low sample

Most threatening pitching a good length on the 5th stump (4 wkts, 1.9% strike). Most wickets come from full on the stumps, while he leaks the most runs full on the stumps.
Zone shares are over his **mapped** wickets — 3 wickets pitched too full to place on the map (tracked length at/behind the crease), so they sit outside the grid.

Match-ups (vs left-handers)

New ball vs old ball

Split	Balls	Wkts	Avg	Econ	SR	False%	Med length
New ball (≤30 ov)	377	5	34.0	2.71	75.4	11%	4.60 m
Old ball (31+ ov)	530	10	24.8	2.81	53.0	10%	4.44 m

More yorkers/full at the tail (36%).

Lower average / higher false-shot = the match-up that suits him; higher average = where batters have got on top. Med length = his median pitch length in that split.

By batting position

Split	Balls	Wkts	Avg	Econ	SR	False%	Med length
Top order (1–3)	332	4	31.2	2.26	83.0	12%	4.68 m
Middle (4–7)	437	7	33.6	3.23	62.4	9%	4.46 m
Tail (8–11)	138	4	14.5	2.52	34.5	9%	4.54 m

Scoring Profile (vs left-handers)

45% of his runs come in boundaries — a boundary every 20 balls; most runs go to the leg side (44%); the cut hurts most (8 fours/sixes at 2.3 runs/ball).

BOUNDARY %
45%
runs in 4s/6s

ROTATED %

Work/Nudge	39	52	21%	1	1.33
Cut	21	48	19%	8	2.29
Pull/Hook	8	36	14%	8	4.50
Sweep	10	22	9%	2	2.20

Direction from ball-tracking (all scoring shots); shot type recorded on 63% of scoring balls (142/225) — groups with <5 balls omitted.

Pitch Maps & Scoring

Where They Pitch It

Pitches it full on the stumps most often (29%); rarely drops short (0%).

Where Wickets Come From

Wickets come mostly from balls pitched full on the stumps, but strikes most often pitching on the 5th stump.

Speed & Spells

He drops ~2.1 km/h from his opening spell to later spells, keeps his pace into the 2nd innings, and is as quick on the final day as day one.

Speed by Spell

By spell — opening burst vs later spells.

Speed by Innings

1st vs 2nd innings of the match.

Speed by Day

By match day — fatigue across the game.

Over vs Round the Wicket (vs left-handers)

Almost exclusively round the wicket to left-handers (97%, 879 balls); the over the wicket sample (28 balls) is too small to read into.

Angle	Balls	Pitch line	Length	Short %	Econ	Wkts	Bdry %
Over	28 (3%)	Down leg	4.2 m	0%	4.29	0	40%
Round	879 (97%)	Stumps	4.5 m	0%	2.72	15	46%

Over the Wicket

Over the wicket — only 28 balls to left-handers, too few to read into.

Round the Wicket

Where he pitches it from round the wicket (879 balls).

Sequencing & Over Construction

Relentlessly consistent — repeats his length ball after ball (length spread ± 0.9 m; more repeatable than 79% of spin bowlers); holds a steady length right through the over; and holds the same crease position through the over.

Often strikes with a shorter ball than the previous one (22% of dismissals).

Across 31 dismissals, his wicket ball is close in length and pace to the delivery before it — he builds pressure with repetition, not a big change-up.

Ball in over	Median length	Short %	Econ	Wkt %
Ball 1	4.6 m	0%	2.91	1.3%
Ball 2	4.4 m	0%	2.52	2.0%
Ball 3	4.6 m	0%	2.38	1.9%
Ball 4	4.4 m	0%	2.59	2.0%
Ball 5	4.6 m	0%	3.02	2.0%
Ball 6	4.6 m	0%	3.22	0.7%

Length spread = std-dev of pitch length (smaller = more repeatable). The table shows how his length, scoring and wicket rate shift across the six balls of an over. Set-up lines compare each ball with the previous delivery in the same over (career, all batters).

Release Point & Crease Use

A high release point (taller than 89% of right-arm spin); releases about 69 cm from the middle stump.

Crease position	% balls	Balls	Econ	Wkts	Avg	SR
Standard (45–75)	46%	1,213	3.49	23	30.7	53
Wide (>75cm)	53%	1,404	2.80	24	27.3	58

How he goes when he releases tight / standard / wide of the middle stump (all release-tracked balls).

Angle	Balls	Tight	Standard	Wide
Over the wicket	54%	1%	66%	33%
Round the wicket	46%	0%	22%	77%

His crease-position mix, split by over vs round. Release data is modern-era (2017+); percentiles vs same hand + type.

Where he lets the ball go — lateral position × height (purple density). Over and round labelled; dotted lines mark tight/standard/wide and the return creases.

Movement (vs the average spin bowler · vs left-handers)

A big turner of the ball; skids it on with lower bounce.

Generates above avg turn and about average drift for a spin bowler; turns it away more to left-hand batters (99%).

Percentile vs all Test spin bowlers; direction is which way it moves to this batter. Bounce = extra bounce vs expected.

Movement	Avg	vs average	Direction (vs left-handers)
Drift	1.73°	59th pct (about average)	1% away / 99% in
Turn	4.38°	79th pct (above avg)	100% away / 0% in
Bounce	4.1°	27th pct (below avg)	—

Beaten — Grid

Length × line where he beats the bat — exact counts per cell.

Beaten — Heatmap

The same play-and-miss density, smoothed, with pitch markings.

Beats the bat most at **Full / Stumps** (41% of play-and-misses). Overall he beats the bat 4.2% of tracked balls (false-shot 10.5%, n=907).

Test-match career data. Beaten/false-shot use ~38% shot-quality tracking; turn/drift ~30% ball-tracking. Catches split by fielding position (DeliveryFielders view); some catches have no recorded position. Danger zones use empirical-Bayes shrinkage (≥3 wks to qualify).
