Scouting Summary

COMMON THEMES

- Left Orthodox, averaging 79.6 kph (up to 85.8).
- Typical length is **4-5m** (their good length); median 4.4 m.
- Stock ball is **full in the channel, turning away, drifting in, hitting the top of off** (25% of deliveries).
- Goes round the wicket 97% of the time against right-handers.
- Turns it 3.6° on average; 19% of balls turn ≥5°.
- Across an over he **repeats his length ball after ball**.

BIGGEST THREATS

- Most dangerous length is **Full** (9 wkts, 3.1% adjusted strike).
- Danger pitching line: **Stumps**.
- Takes 27% of wickets pitching **full in the 4th-stump channel**.
- Beats the bat 6.4% of tracked balls (false-shot 19.5%).
- Gets you **LBW** more than most — 33% of his wickets (1.7× the typical rate for this type).
- 40% of catches are behind the wicket (keeper / slips / gully); most often to slip: 1st, cover: short extra, long off: regulation.
- Very repeatable with his length — using your feet to change his length is more effective than waiting for a loose ball.

AREAS TO EXPLOIT

- Concedes most runs pitching **full on the stumps** (18% of runs).
- Away from full, the wicket threat drops off — look to score in the less-productive lengths.
- Most of his runs leak through the leg side (51%) — his main scoring release.
- Cash in when he goes **good length outside off** (economy 3.4, beats the bat only 18%).

Repeatability

P82 → P83

±0.9 m · vs spin bowlers

Solid line = career, dotted = last 3 years (where enough recent balls). Percentile within same-type peers (grey = the peer distribution, line = this bowler). Release/crease vs hand × pace/spin; movement/speed/repeatability vs pace/spin. Release & speed are modern-era (2017+ / partial). **Crease variation** = how much he moves his release point sideways across the crease from ball to ball (within his main angle): a high percentile = he varies where he lets the ball go a lot, a low percentile = he releases from the same spot every ball. **Repeatability** = length consistency over his stock-length band (2–11 m, so deliberate yorkers and bouncers don't count as poor control): a high percentile = tighter, more metronomic lengths than peers; a low percentile = he varies his length more. A marker at the very edge = he sits beyond the typical peer range on that trait.

in-air

How he gets you out	His %	Base	Index	Catches to: Slip: 1st 2 Cover: short extra 1 Long off: regulation 1
Caught	42%	58%	0.72×	Mid off: regulation 1
LBW	33%	20%	1.71×	Angle & variations: Round the wicket to RHB (97%), stays over to LHB
Bowled	17%	17%	0.98×	

Share of his 12 wickets by type, indexed against the base rate vs the average spin bowler to RHB (men's Tests). **Index** >1 = he does it more than most, <1 = less. Caught is high for everyone — the signal is the over-indexed row.

Stock Ball & Ball Types (vs right-handers)

▶ watch stock balls

Stock ball — full in the channel, turning away, drifting in, hitting the top of off (25% of deliveries, economy 1.13). Minor variations: full on the stumps (22%) and full outside off (21%).

Ball type (pitch length × pitching line)	Movement	%	Econ	Wkts	Beaten %
full in the channel 	turning away, drifting in	25%	1.13	3	18%
full on the stumps 	turning away, drifting in	22%	1.98	3	24%
full outside off 	turning away, drifting in	21%	3.18	3	19%
a good length in the channel 	turning away, drifting in	11%	3.26	0	13%
a good length outside off 	turning away, drifting in	8%	3.35	1	18%
a good length on the stumps 	turning away, drifting in	5%	3.00	1	27%

Ball type = pitch-length band × pitching-line region. **Movement** = swing in the air + seam/turn off the pitch, whichever is material, dominant first (ball-tracking, tracked balls only; blank if too few). **Beaten** % = false-shot rate on tracked balls. The stock-ball line above also notes where it passes the stumps.

New ball vs old ball

Old ball (31+ ov) · 334 balls · 7 wkts · econ 2.95

Top ball type	%	Econ	Wkts
full outside off	24%	3.21	2
full on the stumps	23%	1.89	2
full in the channel	22%	1.20	1
a good length in the channel	10%	4.45	0

How his ball types and threat shift with ball age (split at 30 overs). Empty side = too few balls in that phase.

Danger Zones (vs right-handers)

▶ watch danger balls

WICKETS — WHERE MOST CAME FROM

Full in the 4th-stump channel

27% of mapped wickets (3 of 11)

RUNS — WHERE MOST CONCEDED

Full on the stumps

18% of runs (29 of 157)

DANGER LINE

Stumps

5 wkts / 145 balls · 3.2% adj (3.4% raw)

DANGER LENGTH

Full

9 wkts / 283 balls · 3.1% adj (3.2% raw)

MOST LETHAL ZONE (BY RATE)

Full / Stumps

3 wkts / 86 balls · 3.1% adj (3.5% raw) · low sample

Most threatening pitching full on the stumps (9 wkts, 3.1% strike). Most wickets come from full in the 4th-stump channel, while he leaks the most runs full on the stumps.

Zone shares are over his **mapped** wickets — 1 wicket pitched too full to place on the map (tracked length at/behind the crease), so they sit outside the grid.

Match-ups (vs right-handers)

New ball vs old ball

Split	Balls	Wkts	Avg	Econ	SR	False%	Med length
Old ball (31+ ov)	334	7	23.4	2.95	47.7	20%	4.50 m

Lower average / higher false-shot = the match-up that suits him; higher average = where batters have got on top. Med length = his median pitch length in that split.

By batting position

Split	Balls	Wkts	Avg	Econ	SR	False%	Med length
Middle (4–7)	263	6	16.8	2.30	43.8	17%	4.58 m
Tail (8–11)	145	4	21.2	3.52	36.2	25%	4.52 m

Vs Our Squad (simulated matchups)

From the match simulation — each pairing played out thousands of times from full Test profiles. Only the matchups that sit clearly away from this bowler's norm are listed; everyone unlisted profiles as roughly average against him. The full grid for every pairing is on the series Match-ups page.

Structurally he takes the ball away from the RHB — harder work for Green, Inglis, Labuschagne, Smith, Webster regardless of individual reads; a left/right pairing at the crease blunts it.

Scoring Profile (vs right-handers)

53% of his runs come in boundaries — a boundary every 19 balls; most runs go to the leg side (51%); the sweep hurts most (8 fours/sixes at 3.4 runs/ball).

BOUNDARY %
53%

Shot type	Balls	Runs	% runs	4s/6s	Runs/ball
Drive	30	57	31%	7	1.90
Sweep	14	47	25%	8	3.36
Work/Nudge	33	39	21%	1	1.18
Slog	6	27	15%	5	4.50
Cut	6	15	8%	2	2.50

Direction from ball-tracking (all scoring shots); shot type recorded on 100% of scoring balls (95/95) — groups with <5 balls omitted.

Pitch Maps & Scoring

At the Stumps (wickets)

Wicket balls pass the stumps mostly at wide of 6th — pitches around stumps and moves it back.

Where They're Scored Off

Runs come mostly on the leg side (61%).

Where They Pitch It

Pitches it full in the 4th-stump channel most often (23%); rarely drops short (0%).

Where Wickets Come From

Wickets come mostly from balls pitched full in the 4th-stump channel, but strikes most often pitching on the stumps.

Speed & Spells

He holds his pace across spells, keeps his pace into the 2nd innings, and is as quick on the final day as day one.

Speed by Spell

By spell — opening burst vs later spells.

Speed by Innings

1st vs 2nd innings of the match.

Speed by Day

By match day — fatigue across the game.

Over vs Round the Wicket (vs right-handers)

Almost exclusively round the wicket to right-handers (97%, 426 balls); the over the wicket sample (11 balls) is too small to read into.

Angle	Balls	Pitch line	Length	Short %	Econ	Wkts	Bdry %
Over	11 (3%)	Down leg	—	—	2.73	0	0%
Round	426 (97%)	4th stump	4.6 m	0%	2.65	12	54%

Over the Wicket

Over the wicket — only 11 balls to right-handers, too few to read into.

Round the Wicket

Where he pitches it from round the wicket (426 balls).

Sequencing & Over Construction

Relentlessly consistent — repeats his length ball after ball (length spread ± 1.0 m; more repeatable than 82% of spin bowlers); holds a steady length right through the over; and holds the same crease position through the over.

Ball in over	Median length	Short %	Econ	Wkt %
Ball 1	4.4 m	0%	2.47	2.7%
Ball 2	4.6 m	0%	3.80	2.8%
Ball 3	4.4 m	0%	2.79	4.1%
Ball 4	4.6 m	0%	3.21	4.1%
Ball 5	4.6 m	0%	1.54	2.7%
Ball 6	4.5 m	0%	2.14	0.0%

Length spread = std-dev of pitch length (smaller = more repeatable). The table shows how his length, scoring and wicket rate shift across the six balls of an over. Set-up lines compare each ball with the previous delivery in the same over (career, all batters).

Release Point & Crease Use

A low, skiddy release point (lower than 88% of left-arm spin); releases wide of the stumps (106 cm out, wider than 93% of left-arm spin).

Crease position	% balls	Balls	Econ	Wkts	Avg	SR
Standard (45–75)	7%	31	2.13	0	—	—
Wide (>75cm)	92%	395	2.37	11	14.2	36

How he goes when he releases tight / standard / wide of the middle stump (all release-tracked balls).

Angle	Balls	Tight	Standard	Wide
Round the wicket	91%	0%	0%	99%

His crease-position mix, split by over vs round. Release data is modern-era (2017+); percentiles vs same hand + type.

Where he lets the ball go — lateral position × height (purple density). Over and round labelled; dotted lines mark tight/standard/wide and the return creases.

Movement (vs the average spin bowler · vs right-handers)

A moderate spinner of the ball; extracts steep bounce; gets sharp drift in the air.

Generates about average turn and well above avg drift for a spin bowler; turns it away more to right-hand batters (100%).

Percentile vs all Test spin bowlers; direction is which way it moves to this batter. Bounce = extra bounce vs expected.

Movement	Avg	vs average	Direction (vs right-handers)
Drift	2.52°	97th pct (well above avg)	0% away / 100% in
Turn	3.64°	50th pct (about average)	100% away / 0% in
Bounce	4.9°	95th pct (well above avg)	—

Beaten — Grid

Length × line where he beats the bat — exact counts per cell.

Beaten — Heatmap

The same play-and-miss density, smoothed, with pitch markings.

Beats the bat most at **Full / Stumps** (33% of play-and-misses). Overall he beats the bat 6.4% of tracked balls (false-shot 19.5%, n=437).

Test-match career data. Beaten/false-shot use ~38% shot-quality tracking; turn/drift ~30% ball-tracking. Catches split by fielding position (DeliveryFielders view); some catches have no recorded position. Danger zones use empirical-Bayes shrinkage (≥3 wks to qualify).
