Scouting Summary

COMMON THEMES

- Right Fast, averaging 134.9 kph (up to 141.1).
- Typical length is **7-8m** (their good length); median 7.5 m.
- Stock ball is **back of a length down the leg side, seaming both ways, swinging, passing outside off** (15% of deliveries).
- Goes round the wicket 41% of the time against left-handers.
- Round the wicket** he shifts his pitching line from down leg to wide of 6th.

BIGGEST THREATS

- Most dangerous length is **Full** (4 wkts, 5.0% adjusted strike).
- Danger pitching line: **Stumps**.
- Takes 33% of wickets pitching a **good length on the stumps**.
- Beats the bat 6.9% of tracked balls (false-shot 19.5%).
- Most likely to dismiss you **caught** (71% of wickets).
- 80% of catches are behind the wicket (keeper / slips / gully); most often to slip: 2nd, keeper, square leg: short leg.
- The wicket ball is usually **shorter** than the one before (47%) — beware the ball that pushes you back.

AREAS TO EXPLOIT

- Concedes most runs pitching **back of a length down the leg side** (25% of runs).
- Short ball: 41% of deliveries, economy 1.3 — 0 wkts from 94 short balls.
- Away from full, the wicket threat drops off — look to score in the less-productive lengths.
- Most of his runs leak through the leg side (43%) — his main scoring release.

Repeatability

P21

±1.8 m · vs pace bowlers

Percentile within same-type peers (grey = the peer distribution, line = this bowler). Release/crease vs hand × pace/spin; movement/speed/repeatability vs pace/spin. Release & speed are modern-era (2017+ / partial). **Crease variation** = how much he moves his release point sideways across the crease from ball to ball (within his main angle): a high percentile = he varies where he lets the ball go a lot, a low percentile = he releases from the same spot every ball. **Repeatability** = length consistency over his stock-length band (2–11 m, so deliberate yorkers and bouncers don't count as poor control): a high percentile = tighter, more metronomic lengths than peers; a low percentile = he varies his length more. A marker at the very edge = he sits beyond the typical peer range on that trait.

He's around his career level lately (avg 15 last 4 vs 15 career).

Window	Balls	Wkts	Avg	Econ	SR	False%	Avg speed	Avg length
Last 4 Tests	1,030	25	15.2	2.21	41.2	20%	134	8.36 m

in-air

How he gets you out	His %	Base	Index
Caught	71%	68%	1.06×
Bowled	29%	18%	1.60×

Share of his 7 wickets by type, indexed against the base rate vs the average pace bowler to LHB (men's Tests). **Index** >1 = he does it more than most, <1 = less. Caught is high for everyone — the signal is the over-indexed row.

Catches to: [Slip: 2nd 2](#) [Keeper 2](#) [Square leg: short leg 1](#)
Angle & variations: Mostly over the wicket (round LHB 40% · RHB 19%) · slower balls 0.9% (~125 kph)

Stock Ball & Ball Types (vs left-handers) [▶ watch stock balls](#)

Stock ball — back of a length down the leg side, seaming both ways, swinging, passing outside off (15% of deliveries, economy 3.00). Minor variations: a good length outside off (12%) and a good length on the stumps (12%).

Ball type (pitch length × pitching line)	Movement	%	Econ	Wkts	Beaten %
back of a length down the leg side ▶	seaming both ways, swinging	15%	3.00	0	12%
a good length outside off ▶	swinging, seaming	12%	1.20	0	28%
a good length on the stumps ▶	swinging in, seaming	12%	0.24	2	24%
a good length wide outside off ▶	swinging, seaming	10%	0.00	0	9%
a good length down the leg side ▶	swinging, seaming	9%	1.20	0	20%
back of a length wide outside off ▶	seaming	7%	0.00	0	20%

Ball type = pitch-length band × pitching-line region. **Movement** = swing in the air + seam/turn off the pitch, whichever is material, dominant first (ball-tracking, tracked balls only; blank if too few). **Beaten %** = false-shot rate on tracked balls. The stock-ball line above also notes where it passes the stumps.

New ball vs old ball

New ball (≤30 ov) · 155 balls · 4 wkts · econ 1.97

Top ball type	%	Econ	Wkts
a good length wide outside off	14%	0.00	0
a good length outside off	12%	0.35	0
a good length on the stumps	10%	0.00	2
back of a length down the leg side	10%	5.14	0

How his ball types and threat shift with ball age (split at 30 overs). Empty side = too few balls in that phase.

Danger Zones (vs left-handers)

WICKETS — WHERE MOST COME FROM
A good length on the stumps
33% of mapped wickets (2 of 6)

RUNS — WHERE MOST CONCEDED
Back of a length down the leg side
25% of runs (16 of 64)

DANGER LINE
Stumps
4 wkts / 56 balls · 4.7% adj (7.1% raw) · low sample

DANGER LENGTH
Full
4 wkts / 44 balls · 5.0% adj (9.1% raw) · low sample

Most threatening pitching full on the stumps (4 wkts, 5.0% strike). Most wickets come from a good length on the stumps, while he leaks the most runs back of a length down the leg side.

Zone shares are over his **mapped** wickets — 1 wicket pitched too full to place on the map (tracked length at/behind the crease), so they sit outside the grid.

Match-ups (vs left-handers)

New ball vs old ball

Split	Balls	Wkts	Avg	Econ	SR	False%	Med length
New ball (≤30 ov)	155	4	12.8	1.97	38.8	20%	7.48 m

By batting position

Split	Balls	Wkts	Avg	Econ	SR	False%	Med length
Top order (1–3)	167	3	15.7	1.69	55.7	17%	7.48 m

Bangs it in more with the old ball (9%→34% short); more short balls at the tail (33% vs 13% to the top 3).

Lower average / higher false-shot = the match-up that suits him; higher average = where batters have got on top. Med length = his median pitch length in that split.

Scoring Profile (vs left-handers)

48% of his runs come in boundaries — a boundary every 29 balls; most runs go to the leg side (43%).

BOUNDARY %

Shot type	Balls	Runs	% runs	4s/6s	Runs/ball
Drive	11	29	48%	3	2.64
Work/Nudge	13	17	28%	1	1.31
Pull/Hook	5	15	25%	3	3.00

Direction from ball-tracking (all scoring shots); shot type recorded on 100% of scoring balls (32/32) — groups with <5 balls omitted.

Pitch Maps & Scoring

Wicket balls pass the stumps mostly at 5th stump — pitches around stumps and moves it back.

Runs come mostly on the leg side (52%).

Where They Pitch It

Pitches it back of a length down the leg side most often (14%); drops short often (40%).

Where Wickets Come From

Wickets come mostly from balls pitched a good length on the stumps, but strikes most often pitching on the stumps.

Speed & Spells

He drops ~1.9 km/h from his opening spell to later spells, is a touch slower in the 2nd innings.

Speed by Spell

By spell — opening burst vs later spells.

Speed by Innings

1st vs 2nd innings of the match.

Speed by Day

By match day — fatigue across the game.

Over vs Round the Wicket (vs left-handers)

Round the wicket his pitching line moves from down leg to wide of 6th — economy 1.97→1.40, a wicket every 46→24 balls (over→round).

Angle	Balls	Pitch line	Length	Short %	Econ	Wkts	Bdry %
Over	137 (59%)	Down leg	7.6 m	22%	1.97	3	44%
Round	94 (41%)	Wide of 6th	7.8 m	16%	1.40	4	55%

Over the Wicket

Where he pitches it from over the wicket (137 balls).

Round the Wicket

Where he pitches it from round the wicket (94 balls).

Sequencing & Over Construction

Moderately consistent with his length (length spread ± 2.2 m; more repeatable than 21% of pace bowlers); tends to bang it in later in the over (short 14%→21% by the 5th–6th ball); and holds the same crease position through the over.

Across 15 dismissals, the wicket ball lands about 28 cm shorter than the ball before it — that's the change that brings the wicket.

Ball in over	Median length	Short %	Econ	Wkt %
Ball 1	7.5 m	10%	1.90	4.9%
Ball 2	7.6 m	18%	1.35	2.5%
Ball 3	8.0 m	24%	2.37	2.6%
Ball 4	7.6 m	18%	1.94	0.0%
Ball 5	8.7 m	30%	2.27	5.4%
Ball 6	7.5 m	13%	0.79	0.0%

Length spread = std-dev of pitch length (smaller = more repeatable). The table shows how his length, scoring and wicket rate shift across the six balls of an over. Set-up lines compare each ball with the previous delivery in the same over (career, all batters).

Release Point & Crease Use

A mid-height release point; releases about 68 cm from the middle stump.

Crease position	% balls	Balls	Econ	Wkts	Avg	SR
Standard (45–75)	72%	644	2.36	15	16.9	43
Wide (>75cm)	28%	253	1.64	7	9.9	36

How he goes when he releases tight / standard / wide of the middle stump (all release-tracked balls).

Angle	Balls	Tight	Standard	Wide
Over the wicket	73%	0%	93%	7%
Round the wicket	27%	0%	13%	87%

His crease-position mix, split by over vs round. Release data is modern-era (2017+); percentiles vs same hand + type.

Where he lets the ball go — lateral position × height (purple density). Over and round labelled; dotted lines mark tight/standard/wide and the return creases.

Movement (vs the average pace bowler · vs left-handers)

A seam bowler who predominantly nips it back off the seam (65%); gets extra bounce.

Generates above avg seam and above avg swing for a pace bowler; seams it in more to left-hand batters (65%).

Swing by ball age to left-hand batters: new ball (≤25 ov, n=70) 34% away / 66% in; old ball (≥40 ov, n=22) 59% away / 41% in — the swing direction reverses with the old ball.

Percentile vs all Test pace bowlers; direction is which way it moves to this batter. Bounce = extra bounce vs expected.

Movement	Avg	vs average	Direction (vs left-handers)
Swing	0.89°	64th pct (above avg)	39% away / 61% in
Seam	0.63°	73rd pct (above avg)	35% away / 65% in
Bounce	4.3°	78th pct (above avg)	—

Beaten — Grid

Length × line where he beats the bat — exact counts per cell.

Beaten — Heatmap

The same play-and-miss density, smoothed, with pitch markings.

Beats the bat most at **Good Length / Down leg** (13% of play-and-misses). Overall he beats the bat 6.9% of tracked balls (false-shot 19.5%, n=231).

Test-match career data. Beaten/false-shot use ~38% shot-quality tracking; turn/drift ~30% ball-tracking. Catches split by fielding position (DeliveryFielders view); some catches have no recorded position. Danger zones use empirical-Bayes shrinkage (≥3 wkts to qualify).
