Scouting Summary

COMMON THEMES

- Right Fast, averaging 138.6 kph (up to 147.3).
- Typical length is **7-8m** (their good length); median 7.7 m.
- Stock ball is **a good length outside off, swinging away, seaming away, passing outside off** (23% of deliveries).
- Goes round the wicket 79% of the time against left-handers.
- Round the wicket** he shifts his pitching line from down leg to 6th stump and pitches fuller, up to 7.8 m.

BIGGEST THREATS

- Most dangerous length is **Back of Length** (8 wkts, 3.8% adjusted strike).
- Danger pitching line: **Down leg**.
- Takes 15% of wickets pitching **back of a length on the 6th stump**.
- Beats the bat 13.3% of tracked balls (false-shot 26.8%).
- Most likely to dismiss you **caught** (81% of wickets).
- 65% of catches are behind the wicket (keeper / slips / gully); most often to keeper, slip: 2nd, point: backward.

AREAS TO EXPLOIT

- Concedes most runs pitching **a good length on the 6th stump** (13% of runs).
- Short ball: 42% of deliveries, economy 2.9 — 10 wkts from 342 short balls.
- Away from back of length, the wicket threat drops off — look to score in the less-productive lengths.
- Most of his runs leak through the leg side (50%) — his main scoring release.
- Cash in when he goes **back of a length outside off** (economy 3.4, beats the bat only 28%).

Repeatability

P27

±1.8 m · vs pace bowlers

Percentile within same-type peers (grey = the peer distribution, line = this bowler). Release/crease vs hand × pace/spin; movement/speed/repeatability vs pace/spin. Release & speed are modern-era (2017+ / partial). **Crease variation** = how much he moves his release point sideways across the crease from ball to ball (within his main angle): a high percentile = he varies where he lets the ball go a lot, a low percentile = he releases from the same spot every ball. **Repeatability** = length consistency over his stock-length band (2–11 m, so deliberate yorkers and bouncers don't count as poor control): a high percentile = tighter, more metronomic lengths than peers; a low percentile = he varies his length more. A marker at the very edge = he sits beyond the typical peer range on that trait.

He's around his career level lately (avg 22 last 5 vs 23 career).

Window	Balls	Wkts	Avg	Econ	SR	False%	Avg speed	Avg length
Last 5 Tests	743	17	21.8	3.00	43.7	29%	140	8.07 m

Slip: 2nd 4

Point: backward 2

Midwicket: regulation 1

Square leg: deep backward 1

Point: deep backward 1

Angle & variations: Round the wicket to LHB (78%), stays over to RHB · slower balls 2.0% (~126 kph)

Stock Ball & Ball Types (vs left-handers) [▶ watch stock balls](#)

Stock ball — a good length outside off, swinging away, seaming away, passing outside off (23% of deliveries, economy 2.72). Minor variations: back of a length outside off (12%) and a good length wide outside off (10%).

Ball type (pitch length × pitching line)	Movement	%	Econ	Wkts	Beaten %
a good length outside off ▶	swinging away, seaming away	23%	2.72	2	27%
back of a length outside off ▶	seaming away, swinging away	12%	3.40	5	28%
a good length wide outside off ▶	swinging away, seaming away	10%	2.96	0	21%
a good length down the leg side ▶	seaming away, swinging away	9%	0.43	2	23%
a good length on the stumps ▶	swinging away, seaming away	8%	2.14	1	31%
full outside off ▶	swinging away, seaming both ways	7%	4.44	2	18%

Ball type = pitch-length band × pitching-line region. **Movement** = swing in the air + seam/turn off the pitch, whichever is material, dominant first (ball-tracking, tracked balls only; blank if too few). **Beaten %** = false-shot rate on tracked balls. The stock-ball line above also notes where it passes the stumps.

New ball vs old ball

New ball (≤30 ov) · 513 balls · 11 wkts · econ 2.94

Top ball type	%	Econ	Wkts
a good length outside off	23%	2.13	1
back of a length outside off	14%	2.82	3
a good length wide outside off	12%	2.56	0
a good length on the stumps	8%	2.46	1

Old ball (31+ ov) · 296 balls · 10 wkts · econ 3.08

Top ball type	%	Econ	Wkts
a good length outside off	23%	3.69	1
a good length down the leg side	13%	0.65	2
back of a length down the leg side	9%	2.08	2
back of a length outside off	8%	5.00	2

How his ball types and threat shift with ball age (split at 30 overs). Empty side = too few balls in that phase.

Danger Zones (vs left-handers) [▶ watch danger balls](#)

WICKETS — WHERE MOST CAME FROM

Back of a length on the 6th stump

15% of mapped wickets (3 of 20)

RUNS — WHERE MOST CONCEDED

A good length on the 6th stump

13% of runs (55 of 408)

DANGER LINE

Down leg

4 wkts / 124 balls · 3.0% adj (3.2% raw) · low sample

DANGER LENGTH

Back of Length

8 wkts / 188 balls · 3.8% adj (4.3% raw)

MOST LETHAL ZONE (BY RATE)

Back of Length / 6th stump

3 wkts / 46 balls · 4.0% adj (6.5% raw) · low sample

Most threatening pitching back of a length down the leg side (8 wkts, 3.8% strike). Most wickets come from back of a length on the 6th stump, while he leaks the most runs a good length on the 6th stump.

Zone shares are over his **mapped** wickets — 1 wicket pitched too full to place on the map (tracked length at/behind the crease), so they sit outside the grid.

Match-ups (vs left-handers)

New ball vs old ball

Split	Balls	Wkts	Avg	Econ	SR	False%	Med length
New ball (≤30 ov)	513	11	22.8	2.94	46.6	27%	7.77 m
Old ball (31+ ov)	296	10	15.2	3.08	29.6	26%	8.00 m

Bangs it in more with the old ball (5%→13% short).

Lower average / higher false-shot = the match-up that suits him; higher average = where batters have got on top. Med length = his median pitch length in that split.

Scoring Profile (vs left-handers)

64% of his runs come in boundaries — a boundary every 13 balls; most runs go to the leg side (50%); the drive hurts most (28 fours/sixes at 3.0 runs/ball).

BOUNDARY %
64%
runs in 4s/6s

Shot type	Balls	Runs	% runs	4s/6s	Runs/ball
Drive	51	152	39%	28	2.98
Work/Nudge	71	124	32%	15	1.75
Pull/Hook	31	81	21%	15	2.61
Cut	15	26	7%	3	1.73

Direction from ball-tracking (all scoring shots); shot type recorded on 100% of scoring balls (179/179) — groups with <5 balls omitted.

Pitch Maps & Scoring

Wicket balls pass the stumps mostly at wide of 6th — pitches around 5th stump and moves it back.

Runs come mostly on the leg side (57%).

Where They Pitch It

Pitches it a good length on the 6th stump most often (12%); drops short often (42%).

Where Wickets Come From

Wickets come mostly from balls pitched back of a length on the 6th stump, but strikes most often pitching down the leg side.

Speed & Spells

He holds his pace across spells, keeps his pace into the 2nd innings, and is as quick on the final day as day one.

Speed by Spell

By spell — opening burst vs later spells.

Speed by Innings

1st vs 2nd innings of the match.

Speed by Day

By match day — fatigue across the game.

Over vs Round the Wicket (vs left-handers)

Round the wicket his pitching line moves from down leg to 6th stump; and pitches 32 cm fuller — economy 1.80→3.31, a wicket every 24→46 balls (over→round).

Angle	Balls	Pitch line	Length	Short %	Econ	Wkts	Bdry %
Over	170 (21%)	Down leg	8.1 m	15%	1.80	7	55%
Round	639 (79%)	6th stump	7.8 m	12%	3.31	14	65%

Over the Wicket

Where he pitches it from over the wicket (170 balls).

Round the Wicket

Where he pitches it from round the wicket (639 balls).

Sequencing & Over Construction

Moderately consistent with his length (length spread ±2.0 m; more repeatable than 27% of pace bowlers); tends to bang it in later in the over (short 10%→15% by the 5th–6th ball); and holds the same crease position through the over.

Doubles up on the short ball — pitches up only 32% of the time after banging one in.

Across 36 dismissals, the wicket ball lands about 54 cm fuller than the ball before it — that's the change that brings the wicket.

Ball in over	Median length	Short %	Econ	Wkt %
Ball 1	7.9 m	12%	3.37	3.6%
Ball 2	7.7 m	8%	2.98	2.3%
Ball 3	7.6 m	11%	3.56	1.6%
Ball 4	7.8 m	11%	2.21	2.3%
Ball 5	8.2 m	22%	3.53	3.7%
Ball 6	7.7 m	8%	2.32	2.3%

Length spread = std-dev of pitch length (smaller = more repeatable). The table shows how his length, scoring and wicket rate shift across the six balls of an over. Set-up lines compare each ball with the previous delivery in the same over (career, all batters).

Release Point & Crease Use

A high release point (taller than 97% of right-arm pace); releases wide of the stumps (91 cm out, wider than 94% of right-arm pace). Comes wider over the wicket (91 cm over vs 59 cm round).

Crease position	% balls	Balls	Econ	Wkts	Avg	SR
Standard (45–75)	31%	596	3.19	15	21.1	40
Wide (>75cm)	68%	1,294	3.52	31	24.5	42

How he goes when he releases tight / standard / wide of the middle stump (all release-tracked balls).

Angle	Balls	Tight	Standard	Wide
Over the wicket	69%	0%	1%	98%
Round the wicket	31%	3%	97%	0%

His crease-position mix, split by over vs round. Release data is modern-era (2017+); percentiles vs same hand + type.

Where he lets the ball go — lateral position × height (purple density). Over and round labelled; dotted lines mark tight/standard/wide and the return creases.

Movement (vs the average pace bowler · vs left-handers)

A hit-the-deck bowler who bangs it into a hard length for steep bounce and seams it around.

Generates well above avg seam and about average swing for a pace bowler; seams it away more to left-hand batters (77%).

Swing by ball age to left-hand batters: new ball (≤25 ov, n=235) 86% away / 14% in; old ball (≥40 ov, n=105) 80% away / 20% in.

Percentile vs all Test pace bowlers; direction is which way it moves to this batter. Bounce = extra bounce vs expected.

Movement	Avg	vs average	Direction (vs left-handers)
Swing	0.80°	48th pct (about average)	82% away / 18% in
Seam	0.66°	86th pct (well above avg)	78% away / 22% in
Bounce	4.5°	92nd pct (well above avg)	—

Beaten — Grid

Length × line where he beats the bat — exact counts per cell.

Beaten — Heatmap

The same play-and-miss density, smoothed, with pitch markings.

Beats the bat most at **Good Length / 5th stump** (14% of play-and-misses). Overall he beats the bat 13.3% of tracked balls (false-shot 26.8%, n=809).

Test-match career data. Beaten/false-shot use ~38% shot-quality tracking; turn/drift ~30% ball-tracking. Catches split by fielding position (DeliveryFielders view); some catches have no recorded position. Danger zones use empirical-Bayes shrinkage (≥3 wkts to qualify).
