Scouting Summary

COMMON THEMES

- Right Medium, averaging 127.5 kph (up to 133.4).
- Typical length is **7-8m** (their good length); median 6.6 m.
- Stock ball is a **good length wide outside off, swinging away, seaming away, passing outside off** (26% of deliveries).
- Goes round the wicket 95% of the time against left-handers.

BIGGEST THREATS

- Most dangerous length is **Good Length** (4 wkts, 2.4% adjusted strike).
- Danger pitching line: **Stumps**.
- Takes 40% of wickets pitching a **good length on the 6th stump**.
- Beats the bat 11.4% of tracked balls (false-shot 24.6%).
- Most likely to dismiss you **caught** (75% of wickets).
- 50% of catches are behind the wicket (keeper / slips / gully); most often to slip: 3rd, slip: 2nd, square leg: regulation.

AREAS TO EXPLOIT

- Concedes most runs pitching a **good length wide outside off** (37% of runs).
- Short ball: 20% of deliveries, economy 3.4 — 2 wkts from 58 short balls.
- Away from good length, the wicket threat drops off — look to score in the less-productive lengths.
- Most of his runs leak through the leg side (51%) — his main scoring release.
- Cash in when he goes **good length wide outside off** (economy 3.8, beats the bat only 25%).

Repeatability

P65

±1.6 m · vs pace bowlers

Percentile within same-type peers (grey = the peer distribution, line = this bowler). Release/crease vs hand × pace/spin; movement/speed/repeatability vs pace/spin. Release & speed are modern-era (2017+ / partial). **Crease variation** = how much he moves his release point sideways across the crease from ball to ball (within his main angle): a high percentile = he varies where he lets the ball go a lot, a low percentile = he releases from the same spot every ball. **Repeatability** = length consistency over his stock-length band (2–11 m, so deliberate yorkers and bouncers don't count as poor control): a high percentile = tighter, more metronomic lengths than peers; a low percentile = he varies his length more. A marker at the very edge = he sits beyond the typical peer range on that trait.

He's less penetrative of late (avg 37 in his last 5 Tests vs 25 career).

Window	Balls	Wkts	Avg	Econ	SR	False%	Avg speed	Avg length
Last 5 Tests	927	12	37.3	2.90	77.2	21%	126	7.32 m

AVG SWING
1.11°
in-air

How he gets you out	His %	Base	Index
Caught	75%	68%	1.11×

Share of his 8 wickets by type, indexed against the base rate vs the average pace bowler to LHB (men's Tests). **Index** >1 = he does it more than most, <1 = less. Caught is high for everyone — the signal is the over-indexed row.

Catches to: [Slip: 3rd 2](#) [Slip: 2nd 1](#) [Square leg: regulation 1](#)

[Point: backward 1](#) [Midwicket: short 1](#)

Angle & variations: Round the wicket to LHB (95%), stays over to RHB · slower balls 0.4% (~84 kph)

Stock Ball & Ball Types (vs left-handers) [▶ watch stock balls](#)

Stock ball — a good length wide outside off, swinging away, seaming away, passing outside off (26% of deliveries, economy 3.76). Minor variations: a good length outside off (26%) and full outside off (13%).

Ball type (pitch length × pitching line)	Movement	%	Econ	Wkts	Beaten %
a good length wide outside off ▶	swinging away, seaming away	26%	3.76	1	25%
a good length outside off ▶	swinging away, seaming away	26%	1.34	3	19%
full outside off ▶	swinging away, seaming away	13%	3.00	0	37%
a good length in the channel ▶	swinging away, seaming away	11%	2.75	0	29%
a good length on the stumps ▶	swinging, seaming	6%	3.00	0	—
full on the stumps ▶	swinging, seaming	4%	6.75	0	—

Ball type = pitch-length band × pitching-line region. **Movement** = swing in the air + seam/turn off the pitch, whichever is material, dominant first (ball-tracking, tracked balls only; blank if too few). **Beaten %** = false-shot rate on tracked balls. The stock-ball line above also notes where it passes the stumps.

New ball vs old ball

New ball (≤30 ov) · 207 balls · 5 wkts · econ 3.16

Top ball type	%	Econ	Wkts
a good length outside off	29%	1.53	3
a good length wide outside off	17%	5.14	0
full outside off	15%	3.60	0
a good length in the channel	12%	2.40	0

How his ball types and threat shift with ball age (split at 30 overs). Empty side = too few balls in that phase.

Danger Zones (vs left-handers)

WICKETS — WHERE MOST CAME FROM
A good length on the 6th stump
40% of mapped wickets (2 of 5)

RUNS — WHERE MOST CONCEDED
A good length wide outside off
37% of runs (37 of 101)

DANGER LINE
Stumps
3 wkts / 84 balls · 3.2% adj (3.6% raw) · low sample

DANGER LENGTH
Good Length
4 wkts / 160 balls · 2.4% adj (2.5% raw) · low sample

Most threatening pitching a good length on the stumps (4 wkts, 2.4% strike). Most wickets come from a good length on the 6th stump, while he leaks the most runs a good length wide outside off.

Zone shares are over his **mapped** wickets — 3 wickets pitched too full to place on the map (tracked length at/behind the crease), so they sit outside the grid.

Match-ups (vs left-handers)

New ball vs old ball

Split	Balls	Wkts	Avg	Econ	SR	False%	Med length
New ball (≤30 ov)	207	5	21.8	3.16	41.4	27%	6.99 m

By batting position

Split	Balls	Wkts	Avg	Econ	SR	False%	Med length
Top order (1–3)	221	4	25.8	2.80	55.2	23%	7.13 m

Bangs it in more with the old ball (0%→7% short).

Lower average / higher false-shot = the match-up that suits him; higher average = where batters have got on top. Med length = his median pitch length in that split.

Scoring Profile (vs left-handers)

64% of his runs come in boundaries — a boundary every 13 balls; most runs go to the leg side (51%); the drive hurts most (10 fours/sixes at 2.6 runs/ball).

BOUNDARY %
64%
runs in 4s/6s

ROTATED %

Shot type	Balls	Runs	% runs	4s/6s	Runs/ball
Drive	20	53	40%	10	2.65
Work/Nudge	29	41	31%	2	1.41
Pull/Hook	6	18	14%	4	3.00

Direction from ball-tracking (all scoring shots); shot type recorded on 100% of scoring balls (64/64) — groups with <5 balls omitted.

Pitch Maps & Scoring

Where They Pitch It

Pitches it a good length wide outside off most often (25%); mixes in the short ball (20%).

Where Wickets Come From

Wickets come mostly from balls pitched a good length on the 6th stump, but strikes most often pitching on the stumps.

Speed & Spells

He drops ~2.4 km/h from his opening spell to later spells, is a touch slower in the 2nd innings.

Speed by Spell

By spell — opening burst vs later spells.

Speed by Innings

1st vs 2nd innings of the match.

Speed by Day

By match day — fatigue across the game.

Over vs Round the Wicket (vs left-handers)

Almost exclusively round the wicket to left-handers (95%, 275 balls); the over the wicket sample (14 balls) is too small to read into.

Angle	Balls	Pitch line	Length	Short %	Econ	Wkts	Bdry %
Over	14 (5%)	Down leg	—	—	1.71	1	0%
Round	275 (95%)	Stumps	7.1 m	4%	2.99	7	66%

Over the Wicket

Over the wicket — only 14 balls to left-handers, too few to read into.

Round the Wicket

Where he pitches it from round the wicket (275 balls).

Sequencing & Over Construction

Metronomic — hammers the same length repeatedly, little to feast on (length spread ± 1.8 m; more repeatable than 65% of pace bowlers); drops shorter early, then pitches up later in the over; and holds the same crease position through the over.

Ball in over	Median length	Short %	Econ	Wkt %
Ball 1	6.6 m	10%	3.35	5.8%
Ball 2	7.4 m	0%	2.42	3.8%
Ball 3	7.2 m	2%	2.75	0.0%
Ball 4	7.2 m	11%	2.94	2.1%
Ball 5	7.0 m	2%	3.27	2.3%
Ball 6	7.2 m	0%	2.87	2.2%

Length spread = std-dev of pitch length (smaller = more repeatable). The table shows how his length, scoring and wicket rate shift across the six balls of an over. Set-up lines compare each ball with the previous delivery in the same over (career, all batters).

Release Point & Crease Use

A mid-height release point; releases about 72 cm from the middle stump.

Crease position	% balls	Balls	Econ	Wkts	Avg	SR
Standard (45–75)	52%	391	2.72	4	44.2	98
Wide (>75cm)	48%	366	2.77	6	28.2	61

How he goes when he releases tight / standard / wide of the middle stump (all release-tracked balls).

Angle	Balls	Tight	Standard	Wide
Over the wicket	70%	0%	73%	27%
Round the wicket	30%	0%	2%	98%

His crease-position mix, split by over vs round. Release data is modern-era (2017+); percentiles vs same hand + type.

Where he lets the ball go — lateral position × height (purple density). Over and round labelled; dotted lines mark tight/standard/wide and the return creases.

Movement (vs the average pace bowler · vs left-handers)

A swing bowler who almost exclusively outswing (87%).

Generates above avg seam and well above avg swing for a pace bowler; seams it away more to left-hand batters (87%).

Swing by ball age to left-hand batters: new ball (≤25 ov, n=128) 91% away / 9% in; old ball (≥40 ov, n=30) 63% away / 37% in.

Percentile vs all Test pace bowlers; direction is which way it moves to this batter. Bounce = extra bounce vs expected.

Movement	Avg	vs average	Direction (vs left-handers)
Swing	1.11°	87th pct (well above avg)	87% away / 13% in
Seam	0.63°	75th pct (above avg)	88% away / 12% in
Bounce	4.0°	45th pct (about average)	—

Beaten — Grid

Length × line where he beats the bat — exact counts per cell.

Beaten — Heatmap

The same play-and-miss density, smoothed, with pitch markings.

Beats the bat most at **Good Length / Wide of 6th** (40% of play-and-misses). Overall he beats the bat 11.4% of tracked balls (false-shot 24.6%, n=289).

Test-match career data. Beaten/false-shot use ~38% shot-quality tracking; turn/drift ~30% ball-tracking. Catches split by fielding position (DeliveryFielders view); some catches have no recorded position. Danger zones use empirical-Bayes shrinkage (≥3 wkts to qualify).
