Scouting Summary

COMMON THEMES

- Right Medium, averaging 126.2 kph (up to 134.5).
- Typical length is **6-7m** (their good length); median 6.7 m.
- Stock ball is **a good length outside off, seaming both ways, swinging away, passing outside off** (24% of deliveries).
- Goes round the wicket 56% of the time against left-handers.
- Round the wicket** he shifts his pitching line from stumps to 6th stump.

BIGGEST THREATS

- Most dangerous length is **Good Length** (5 wkts, 1.8% adjusted strike).
- Takes 25% of wickets pitching **a good length on the stumps**.
- Beats the bat 6.4% of tracked balls (false-shot 17.3%).
- Most likely to dismiss you **caught** (88% of wickets).
- 71% of catches are behind the wicket (keeper / slips / gully); most often to keeper, point: regulation, square leg: deep.

AREAS TO EXPLOIT

- Concedes most runs pitching **a good length on the stumps** (15% of runs).
- Short ball: 16% of deliveries, economy 4.1 — 1 wkts from 68 short balls.
- Away from good length, the wicket threat drops off — look to score in the less-productive lengths.
- Most of his runs leak square/through the off side (43%) — his main scoring release.
- Cash in when he goes **full on the stumps** (economy 4.4, beats the bat only 24%).

Repeatability

P90

±1.3 m · vs pace bowlers

Percentile within same-type peers (grey = the peer distribution, line = this bowler). Release/crease vs hand × pace/spin; movement/speed/repeatability vs pace/spin. Release & speed are modern-era (2017+ / partial). **Crease variation** = how much he moves his release point sideways across the crease from ball to ball (within his main angle): a high percentile = he varies where he lets the ball go a lot, a low percentile = he releases from the same spot every ball. **Repeatability** = length consistency over his stock-length band (2–11 m, so deliberate yorkers and bouncers don't count as poor control): a high percentile = tighter, more metronomic lengths than peers; a low percentile = he varies his length more. A marker at the very edge = he sits beyond the typical peer range on that trait.

He's around his career level lately (avg 22 last 5 vs 25 career).

Window	Balls	Wkts	Avg	Econ	SR	False%	Avg speed	Avg length
Last 5 Tests	971	21	22.0	2.85	46.2	19%	125	6.74 m

in-air

How he gets you out	His %	Base	Index
Caught	88%	68%	1.29×

Share of his 8 wickets by type, indexed against the base rate vs the average pace bowler to LHB (men's Tests). **Index** >1 = he does it more than most, <1 = less. Caught is high for everyone — the signal is the over-indexed row.

Catches to: [Keeper 4](#) [Point: regulation 1](#) [Square leg: deep 1](#) [Gully 1](#)
Angle & variations: Round the wicket to LHB (55%), stays over to RHB · slower balls 1.7% (~116 kph)

Stock Ball & Ball Types (vs left-handers) [▶ watch stock balls](#)

Stock ball — a good length outside off, seaming both ways, swinging away, passing outside off (24% of deliveries, economy 1.80). Minor variations: a good length on the stumps (15%) and a good length down the leg side (13%).

Ball type (pitch length × pitching line)	Movement	%	Econ	Wkts	Beaten %
a good length outside off ▶	seaming both ways, swinging away	24%	1.80	2	20%
a good length on the stumps ▶	seaming both ways, swinging away	15%	2.86	2	23%
a good length down the leg side ▶	swinging away, seaming both ways	13%	2.89	0	15%
full outside off ▶	swinging away, seaming both ways	11%	4.13	0	11%
a good length wide outside off ▶	swinging away, seaming both ways	10%	1.12	0	12%
full on the stumps ▶	swinging away, seaming away	8%	4.41	0	24%

Ball type = pitch-length band × pitching-line region. **Movement** = swing in the air + seam/turn off the pitch, whichever is material, dominant first (ball-tracking, tracked balls only; blank if too few). **Beaten %** = false-shot rate on tracked balls. The stock-ball line above also notes where it passes the stumps.

New ball vs old ball

New ball (≤30 ov) · 210 balls · 5 wkts · econ 2.77

Top ball type	%	Econ	Wkts
a good length outside off	32%	1.34	2
full outside off	12%	4.08	0
a good length wide outside off	12%	0.96	0
a good length on the stumps	11%	2.00	1

Old ball (31+ ov) · 212 balls · 3 wkts · econ 3.40

Top ball type	%	Econ	Wkts
a good length on the stumps	20%	3.37	1
a good length down the leg side	17%	3.43	0
a good length outside off	16%	2.73	0
full on the stumps	10%	3.43	0

How his ball types and threat shift with ball age (split at 30 overs). Empty side = too few balls in that phase.

Danger Zones (vs left-handers)

WICKETS — WHERE MOST CAME FROM

A good length on the stumps
25% of mapped wickets (2 of 8)

RUNS — WHERE MOST CONCEDED

A good length on the stumps
15% of runs (33 of 224)

DANGER LENGTH

Good Length
5 wkts / 288 balls · 1.8% adj (1.7% raw)

Most wickets come from a good length on the stumps, while he leaks the most runs a good length on the stumps.

Match-ups (vs left-handers)

New ball vs old ball

Split	Balls	Wkts	Avg	Econ	SR	False%	Med length
New ball (≤30 ov)	210	5	19.4	2.77	42.0	20%	6.66 m
Old ball (31+ ov)	212	3	40.0	3.40	70.7	15%	6.89 m

By batting position

Split	Balls	Wkts	Avg	Econ	SR	False%	Med length
Top order (1–3)	150	5	13.0	2.60	30.0	17%	6.69 m
Middle (4–7)	233	1	111.0	2.86	233.0	13%	6.82 m

Bangs it in more with the old ball (0%→8% short); more short balls at the tail (26% vs 1% to the top 3); more yorkers/full at the tail (18%).

Lower average / higher false-shot = the match-up that suits him; higher average = where batters have got on top. Med length = his median pitch length in that split.

Scoring Profile (vs left-handers)

45% of his runs come in boundaries — a boundary every 18 balls; most runs go to the off side (43%); the drive hurts most (12 fours/sixes at 2.2 runs/ball).

BOUNDARY %
45%
runs in 4s/6s

ROTATED %

Shot type	Balls	Runs	% runs	4s/6s	Runs/ball
Work/Nudge	57	89	44%	7	1.56
Drive	36	80	39%	12	2.22
Pull/Hook	11	26	13%	3	2.36

Direction from ball-tracking (all scoring shots); shot type recorded on 100% of scoring balls (120/120) — groups with <5 balls omitted.

Pitch Maps & Scoring

Wicket balls pass the stumps mostly at 6th stump — pitches around stumps and moves it back.

Runs come mostly on the off side (71%).

Where They Pitch It

Pitches it a good length on the stumps most often (15%); mixes in the short ball (16%).

Where Wickets Come From

Wickets come mostly from balls pitched a good length on the stumps.

Speed & Spells

He is ~5.5 km/h quicker in later spells, is a touch slower in the 2nd innings, and loses ~2.8 km/h by the later days.

Speed by Spell

By spell — opening burst vs later spells.

Speed by Innings

1st vs 2nd innings of the match.

Speed by Day

By match day — fatigue across the game.

Over vs Round the Wicket (vs left-handers)

Round the wicket his pitching line moves from stumps to 6th stump — economy 3.77→2.54, a wicket every 46→59 balls (over→round).

Angle	Balls	Pitch line	Length	Short %	Econ	Wkts	Bdry %
Over	186 (44%)	Stumps	6.9 m	5%	3.77	4	53%
Round	236 (56%)	6th stump	6.7 m	4%	2.54	4	36%

Over the Wicket

Where he pitches it from over the wicket (186 balls).

Round the Wicket

Where he pitches it from round the wicket (236 balls).

Sequencing & Over Construction

Metronomic — hammers the same length repeatedly, little to feast on (length spread ±1.6 m; more repeatable than 90% of pace bowlers); holds a steady length right through the over; and holds the same crease position through the over.

Across 22 dismissals, his wicket ball is close in length and pace to the delivery before it — he builds pressure with repetition, not a big change-up.

Ball in over	Median length	Short %	Econ	Wkt %
Ball 1	7.0 m	1%	2.08	1.4%
Ball 2	6.8 m	3%	1.81	4.1%
Ball 3	6.8 m	3%	4.20	0.0%
Ball 4	6.5 m	10%	2.87	2.8%
Ball 5	6.7 m	6%	3.13	2.8%
Ball 6	6.5 m	3%	4.80	0.0%

Length spread = std-dev of pitch length (smaller = more repeatable). The table shows how his length, scoring and wicket rate shift across the six balls of an over. Set-up lines compare each ball with the previous delivery in the same over (career, all batters).

Release Point & Crease Use

A mid-height release point; releases wide of the stumps (74 cm out, wider than 71% of right-arm pace); varies his spot on the crease a lot (more than 73% of right-arm pace).

Crease position	% balls	Balls	Econ	Wkts	Avg	SR
Standard (45–75)	58%	760	2.97	14	26.9	54
Wide (>75cm)	42%	558	2.69	11	22.7	51

How he goes when he releases tight / standard / wide of the middle stump (all release-tracked balls).

Angle	Balls	Tight	Standard	Wide
Over the wicket	82%	0%	55%	45%
Round the wicket	18%	0%	68%	32%

His crease-position mix, split by over vs round. Release data is modern-era (2017+); percentiles vs same hand + type.

Where he lets the ball go — lateral position × height (purple density). Over and round labelled; dotted lines mark tight/standard/wide and the return creases.

Movement (vs the average pace bowler · vs left-handers)

A seam bowler who moves it both ways (57% away / 43% in); skids through at a lower trajectory.

Generates above avg seam and well below avg swing for a pace bowler; seams it away more to left-hand batters (56%).

Swing by ball age to left-hand batters: new ball (≤ 25 ov, n=78) 73% away / 27% in; old ball (≥ 40 ov, n=80) 82% away / 18% in.

Percentile vs all Test pace bowlers; direction is which way it moves to this batter. Bounce = extra bounce vs expected.

Movement	Avg	vs average	Direction (vs left-handers)
Swing	0.62°	17th pct (well below avg)	79% away / 21% in
Seam	0.61°	62nd pct (above avg)	57% away / 43% in
Bounce	3.7°	17th pct (well below avg)	—

Beaten — Grid

Length × line where he beats the bat — exact counts per cell.

Beaten — Heatmap

The same play-and-miss density, smoothed, with pitch markings.

Beats the bat most at **Good Length / Stumps** (22% of play-and-misses). Overall he beats the bat 6.4% of tracked balls (false-shot 17.3%, n=422).

Test-match career data. Beaten/false-shot use ~38% shot-quality tracking; turn/drift ~30% ball-tracking. Catches split by fielding position (DeliveryFielders view); some catches have no recorded position. Danger zones use empirical-Bayes shrinkage (≥3 wkts to qualify).
