Scouting Summary

COMMON THEMES

- Off Spin, averaging 84.6 kph (up to 91.2).
- Typical length is **4-5m** (their good length); median 4.4 m.
- Stock ball is **full outside off, turning away, drifting in, passing outside off** (27% of deliveries).
- Goes round the wicket 100% of the time against left-handers.
- Turns it 4.0° on average; 26% of balls turn ≥5°.

BIGGEST THREATS

- Most dangerous length is **Full** (4 wkts, 2.0% adjusted strike).
- Takes 33% of wickets pitching **full in the 4th-stump channel**.
- Beats the bat 10.2% of tracked balls (false-shot 14.1%).
- Most likely to dismiss you **caught** (50% of wickets).
- 0% of catches are behind the wicket (keeper / slips / gully); most often to cover: short extra, fine leg: short.
- Very repeatable with his length — using your feet to change his length is more effective than waiting for a loose ball.

AREAS TO EXPLOIT

- Concedes most runs pitching **full on the stumps** (16% of runs).
- Away from full, the wicket threat drops off — look to score in the less-productive lengths.
- Most of his runs leak straight down the ground (37%) — his main scoring release.
- Cash in when he goes **good length outside off** (economy 4.6, beats the bat only 10%).

Repeatability

P66

±1.0 m · vs spin bowlers

Percentile within same-type peers (grey = the peer distribution, line = this bowler). Release/crease vs hand × pace/spin; movement/speed/repeatability vs pace/spin. Release & speed are modern-era (2017+ / partial). **Crease variation** = how much he moves his release point sideways across the crease from ball to ball (within his main angle): a high percentile = he varies where he lets the ball go a lot, a low percentile = he releases from the same spot every ball. **Repeatability** = length consistency over his stock-length band (2–11 m, so deliberate yorkers and bouncers don't count as poor control): a high percentile = tighter, more metronomic lengths than peers; a low percentile = he varies his length more. A marker at the very edge = he sits beyond the typical peer range on that trait.

He's around his career level lately (avg 50 last 5 vs 50 career).

Window	Balls	Wkts	Avg	Econ	SR	False%	Avg speed	Avg length

How he gets you out	His %	Base	Index	Catches to: Cover: short extra 2 Fine leg: short 1
Caught	50%	59%	0.85×	Angle & variations: Uses round the wicket to both (LHB 100% · RHB 27%)

Share of his 6 wickets by type, indexed against the base rate vs the average spin bowler to LHB (men's Tests). **Index** >1 = he does it more than most, <1 = less. Caught is high for everyone — the signal is the over-indexed row.

Stock Ball & Ball Types (vs left-handers) [▶ watch stock balls](#)

Stock ball — full outside off, turning away, drifting in, passing outside off (27% of deliveries, economy 2.77). Minor variations: full on the stumps (25%) and full in the channel (18%).

Ball type (pitch length × pitching line)	Movement	%	Econ	Wkts	Beaten %
full outside off ▶	turning away, drifting in	27%	2.77	2	21%
full on the stumps ▶	turning away, drifting in	25%	2.17	0	11%
full in the channel ▶	turning away, drifting in	18%	2.47	2	8%
a good length outside off ▶	turning away, drifting in	10%	4.55	1	10%
a good length in the channel ▶	turning away, drifting	5%	2.80	0	7%
a good length on the stumps ▶	turning, drifting	5%	2.57	1	—

Ball type = pitch-length band × pitching-line region. **Movement** = swing in the air + seam/turn off the pitch, whichever is material, dominant first (ball-tracking, tracked balls only; blank if too few). **Beaten %** = false-shot rate on tracked balls. The stock-ball line above also notes where it passes the stumps.

New ball vs old ball

Old ball (31+ ov) · 189 balls · 4 wkts · econ 3.81

Top ball type	%	Econ	Wkts
full outside off	29%	2.89	1
full on the stumps	24%	2.40	0
full in the channel	17%	3.45	2
a good length outside off	12%	4.91	1

How his ball types and threat shift with ball age (split at 30 overs). Empty side = too few balls in that phase.

Danger Zones (vs left-handers)

WICKETS — WHERE MOST CAME FROM
Full in the 4th-stump channel
33% of mapped wickets (2 of 6)

RUNS — WHERE MOST CONCEDED
Full on the stumps
16% of runs (25 of 153)

DANGER LENGTH
Full
4 wkts / 211 balls · 2.0% adj (1.9% raw) · low sample

Most wickets come from full in the 4th-stump channel, while he leaks the most runs full on the stumps.

Match-ups (vs left-handers)

New ball vs old ball

Split	Balls	Wkts	Avg	Econ	SR	False%	Med length
Old ball (31+ ov)	189	4	30.0	3.81	47.2	14%	4.40 m

Lower average / higher false-shot = the match-up that suits him; higher average = where batters have got on top. Med length = his median pitch length in that split.

By batting position

Split	Balls	Wkts	Avg	Econ	SR	False%	Med length
Middle (4–7)	148	2	31.0	2.51	74.0	16%	4.39 m

Scoring Profile (vs left-handers)

52% of his runs come in boundaries — a boundary every 17 balls; most runs go to straight down the ground (37%).

Cut	13	26	22%	4	2.00
Slog	6	24	21%	4	4.00
Work/Nudge	14	19	16%	1	1.36
Sweep	6	14	12%	2	2.33

Direction from ball-tracking (all scoring shots); shot type recorded on 72% of scoring balls (56/78) — groups with <5 balls omitted.

Pitch Maps & Scoring

At the Stumps (wickets)

Wicket balls pass the stumps mostly at 6th stump — pitches around 4th stump and moves it back.

Where They're Scored Off

Runs come mostly on the off side (66%).

Where They Pitch It

Pitches it full on the stumps most often (23%); rarely drops short (0%).

Where Wickets Come From

Wickets come mostly from balls pitched full in the 4th-stump channel.

Speed & Spells

He is ~4.7 km/h quicker in later spells, is a touch slower in the 2nd innings, and is as quick on the final day as day one.

Speed by Spell

By spell — opening burst vs later spells.

Speed by Innings

1st vs 2nd innings of the match.

Speed by Day

By match day — fatigue across the game.

Over vs Round the Wicket (vs left-handers)

Bowls exclusively round the wicket to left-handers (284 balls) — never goes over the wicket in this data.

Angle	Balls	Pitch line	Length	Short %	Econ	Wkts	Bdry %
Over	0 (0%)	—	—	—	—	0	—
Round	284 (100%)	Stumps	4.4 m	0%	3.23	6	52%

Over the Wicket

Over the wicket — only 0 balls to left-handers, too few to read into.

Round the Wicket

Where he pitches it from round the wicket (284 balls).

Sequencing & Over Construction

Relentlessly consistent — repeats his length ball after ball (length spread ± 1.0 m; more repeatable than 66% of spin bowlers); holds a steady length right through the over; and holds the same crease position through the over.

Across 12 dismissals, his wicket ball is close in length and pace to the delivery before it — he builds pressure with repetition, not a big change-up.

Ball in over	Median length	Short %	Econ	Wkt %
Ball 1	4.0 m	0%	2.68	0.0%
Ball 2	4.4 m	0%	2.47	0.0%
Ball 3	4.3 m	0%	4.15	5.8%
Ball 4	4.6 m	0%	4.88	0.0%
Ball 5	4.5 m	0%	1.70	4.3%
Ball 6	4.5 m	0%	3.45	2.5%

Length spread = std-dev of pitch length (smaller = more repeatable). The table shows how his length, scoring and wicket rate shift across the six balls of an over. Set-up lines compare each ball with the previous delivery in the same over (career, all batters).

Release Point & Crease Use

A mid-height release point; releases wide of the stumps (99 cm out, wider than 92% of right-arm spin). Comes wider round the wicket (83 cm over vs 99 cm round).

Crease position	% balls	Balls	Econ	Wkts	Avg	SR
Standard (45–75)	19%	178	3.88	2	57.5	89
Wide (>75cm)	81%	748	4.33	11	49.1	68

How he goes when he releases tight / standard / wide of the middle stump (all release-tracked balls).

Angle	Balls	Tight	Standard	Wide
Over the wicket	50%	0%	29%	71%
Round the wicket	50%	0%	9%	91%

His crease-position mix, split by over vs round. Release data is modern-era (2017+); percentiles vs same hand + type.

Where he lets the ball go — lateral position × height (purple density). Over and round labelled; dotted lines mark tight/standard/wide and the return creases.

Movement (vs the average spin bowler · vs left-handers)

A big turner of the ball; gets sharp drift in the air.

Generates above avg turn and well above avg drift for a spin bowler; turns it away more to left-hand batters (100%).

Percentile vs all Test spin bowlers; direction is which way it moves to this batter. Bounce = extra bounce vs expected.

Movement	Avg	vs average	Direction (vs left-handers)
Drift	2.11°	86th pct (well above avg)	0% away / 100% in
Turn	3.96°	65th pct (above avg)	100% away / 0% in
Bounce	4.2°	37th pct (below avg)	—

Beaten — Grid

Length × line where he beats the bat — exact counts per cell.

Beaten — Heatmap

The same play-and-miss density, smoothed, with pitch markings.

Beats the bat most at **Full / 5th stump** (38% of play-and-misses). Overall he beats the bat 10.2% of tracked balls (false-shot 14.1%, n=284).

Test-match career data. Beaten/false-shot use ~38% shot-quality tracking; turn/drift ~30% ball-tracking. Catches split by fielding position (DeliveryFielders view); some catches have no recorded position. Danger zones use empirical-Bayes shrinkage (≥3 wkts to qualify).
