Scouting Summary

COMMON THEMES

- Left Fast, averaging 134.8 kph (up to 143.4).
- Typical length is **6-7m** (their good length); median 7.0 m.
- Stock ball is a **good length outside off, swinging in, seaming both ways, passing outside off** (23% of deliveries).
- Goes round the wicket 7% of the time against left-handers.

BIGGEST THREATS

- Most dangerous length is **Back of Length** (7 wkts, 2.6% adjusted strike).
- Danger pitching line: **4th stump**.
- Takes 17% of wickets pitching a **good length on the 6th stump**.
- Beats the bat 10.2% of tracked balls (false-shot 21.6%).
- Most likely to dismiss you **caught** (79% of wickets).
- 79% of catches are behind the wicket (keeper / slips / gully); most often to keeper, slip: 2nd, midwicket: short.

AREAS TO EXPLOIT

- Concedes most runs pitching **full on the stumps** (12% of runs).
- Short ball: 33% of deliveries, economy 3.6 — 11 wkts from 401 short balls.
- Away from back of length, the wicket threat drops off — look to score in the less-productive lengths.
- Most of his runs leak square/through the off side (39%) — his main scoring release.
- Cash in when he goes **back of a length outside off** (economy 4.4, beats the bat only 10%).

Repeatability

P20

±1.8 m · vs pace bowlers

Percentile within same-type peers (grey = the peer distribution, line = this bowler). Release/crease vs hand × pace/spin; movement/speed/repeatability vs pace/spin. Release & speed are modern-era (2017+ / partial). **Crease variation** = how much he moves his release point sideways across the crease from ball to ball (within his main angle): a high percentile = he varies where he lets the ball go a lot, a low percentile = he releases from the same spot every ball. **Repeatability** = length consistency over his stock-length band (2–11 m, so deliberate yorkers and bouncers don't count as poor control): a high percentile = tighter, more metronomic lengths than peers; a low percentile = he varies his length more. A marker at the very edge = he sits beyond the typical peer range on that trait.

He's around his career level lately (avg 21 last 5 vs 20 career).

Window	Balls	Wkts	Avg	Econ	SR	False%	Avg speed	Avg length

How he gets you out	His %	Base	Index	Catches to: Keeper 10 Slip: 2nd 3 Midwicket: short 2 Gully 1
Caught	79%	68%	1.17×	Point: deep backward 1 Mid on: regulation 1
Bowled	17%	18%	0.93×	Angle & variations: Round the wicket to RHB (47%), stays over to LHB · slower balls 2.6% (~123 kph)

*Share of his 24 wickets by type, indexed against the base rate vs the average pace bowler to LHB (men's Tests). **Index** >1 = he does it more than most, <1 = less. Caught is high for everyone — the signal is the over-indexed row.*

Stock Ball & Ball Types (vs left-handers) [▶ watch stock balls](#)

Stock ball — a good length outside off, swinging in, seaming both ways, passing outside off (23% of deliveries, economy 2.01). Minor variations: a good length wide outside off (13%) and back of a length outside off (9%).

Ball type (pitch length × pitching line)	Movement	%	Econ	Wkts	Beaten %
a good length outside off ▶	swinging in, seaming both ways	23%	2.01	6	19%
a good length wide outside off ▶	swinging both ways, seaming both ways	13%	2.83	3	29%
back of a length outside off ▶	seaming away, swinging in	9%	4.38	2	10%
full outside off ▶	swinging both ways, seaming away	8%	4.32	0	20%
full on the stumps ▶	swinging in, seaming both ways	7%	6.07	2	21%
a good length in the channel ▶	swinging in, seaming away	6%	2.92	1	15%

*Ball type = pitch-length band × pitching-line region. **Movement** = swing in the air + seam/turn off the pitch, whichever is material, dominant first (ball-tracking, tracked balls only; blank if too few). **Beaten %** = false-shot rate on tracked balls. The stock-ball line above also notes where it passes the stumps.*

New ball vs old ball

*Most lethal: **good length 6th stump** (2.9 wkts/100).
How his ball types and threat shift with ball age (split at 30 overs). Empty side = too few balls in that phase.*

Danger Zones (vs left-handers) [▶ watch danger balls](#)

WICKETS — WHERE MOST COME FROM
A good length on the 6th stump
17% of mapped wickets (4 of 23)

RUNS — WHERE MOST CONCEDED
Full on the stumps
12% of runs (80 of 660)

DANGER LINE
4th stump
5 wkts / 154 balls · 2.8% adj (3.2% raw)

DANGER LENGTH
Back of Length
7 wkts / 248 balls · 2.6% adj (2.8% raw)

MOST LETHAL ZONE (BY RATE)
Back of Length / Wide of 6th
4 wkts / 42 balls · 4.6% adj (9.5% raw) · low sample

Most threatening pitching back of a length in the 4th-stump channel (7 wkts, 2.6% strike). Most wickets come from a good length on the 6th stump, while he leaks the most runs full on the stumps.

*Zone shares are over his **mapped** wickets — 1 wicket pitched too full to place on the map (tracked length at/behind the crease), so they sit outside the grid.*

Danger by ball age

NEW BALL (≤30 OV)

good length 6th stump

most lethal cell · 2.9 wkts/100 · danger length full · 10 wkts off 564 balls

OLD BALL (31+ OV)

—

· danger length back of length · 14 wkts off 646 balls

Match-ups (vs left-handers)

New ball vs old ball

Split	Balls	Wkts	Avg	Econ	SR	False%	Med length
New ball (≤30 ov)	564	10	29.2	3.11	56.4	19%	7.14 m
Old ball (31+ ov)	646	14	26.5	3.45	46.1	24%	7.13 m

By batting position

Split	Balls	Wkts	Avg	Econ	SR	False%	Med length
Top order (1–3)	532	8	32.1	2.90	66.5	18%	7.05 m
Middle (4–7)	480	11	27.6	3.80	43.6	22%	7.08 m
Tail (8–11)	198	5	20.4	3.09	39.6	34%	7.68 m

Bangs it in more with the old ball (11%→18% short); more short balls at the tail (27% vs 10% to the top 3).

Lower average / higher false-shot = the match-up that suits him; higher average = where batters have got on top. Med length = his median pitch length in that split.

Scoring Profile (vs left-handers)

55% of his runs come in boundaries — a boundary every 14 balls; most runs go to the off side (39%); the drive hurts most (28 fours/sixes at 2.8 runs/ball).

BOUNDARY %

Drive	60	165	26%	28	2.75
Pull/Hook	43	93	15%	14	2.16
Cut	26	72	12%	14	2.77

Direction from ball-tracking (all scoring shots); shot type recorded on 100% of scoring balls (316/316) — groups with <5 balls omitted.

Pitch Maps & Scoring

Wicket balls pass the stumps mostly at 4th stump — pitches around wide of 6th and moves it back.

Runs come mostly on the off side (57%).

Where They Pitch It

Pitches it a good length wide outside off most often (13%); drops short often (33%).

Where Wickets Come From

Wickets come mostly from balls pitched a good length on the 6th stump, but strikes most often pitching in the 4th-stump channel.

Speed & Spells

He holds his pace across spells, keeps his pace into the 2nd innings, and is as quick on the final day as day one.

Speed by Spell

By spell — opening burst vs later spells.

Speed by Innings

1st vs 2nd innings of the match.

Speed by Day

By match day — fatigue across the game.

Over vs Round the Wicket (vs left-handers)

Almost exclusively over the wicket to left-handers (93%, 1,129 balls); round the wicket is a rare change-up (7%, 81 balls).

Angle	Balls	Pitch line	Length	Short %	Econ	Wkts	Bdry %
Over	1129 (93%)	Wide of 6th	7.0 m	12%	3.37	23	56%
Round	81 (7%)	Down leg	9.7 m	38%	2.15	1	28%

Over the Wicket

Where he pitches it from over the wicket (1129 balls).

Round the Wicket

Where he pitches it from round the wicket (81 balls).

Sequencing & Over Construction

Moderately consistent with his length (length spread ± 2.2 m; more repeatable than 20% of pace bowlers); holds a steady length right through the over; and holds the same crease position through the over.

Doubles up on the short ball — pitches up only 39% of the time after banging one in.

Across 72 dismissals, the wicket ball lands about 69 cm shorter than the ball before it — that's the change that brings the wicket.

Ball in over	Median length	Short %	Econ	Wkt %
Ball 1	7.1 m	15%	3.97	1.4%
Ball 2	7.0 m	13%	2.82	2.0%
Ball 3	7.1 m	11%	3.47	2.4%
Ball 4	7.0 m	10%	2.70	2.5%
Ball 5	7.4 m	18%	3.47	1.6%
Ball 6	7.3 m	16%	3.16	2.2%

Length spread = std-dev of pitch length (smaller = more repeatable). The table shows how his length, scoring and wicket rate shift across the six balls of an over. Set-up lines compare each ball with the previous delivery in the same over (career, all batters).

Release Point & Crease Use

A high release point (taller than 100% of left-arm pace); releases about 47 cm from the middle stump. Comes wider round the wicket (47 cm over vs 101 cm round).

Crease position	% balls	Balls	Econ	Wkts	Avg	SR
Tight (<45cm)	26%	861	3.31	29	16.4	30
Standard (45–75)	40%	1,331	3.04	27	25.0	49
Wide (>75cm)	34%	1,125	3.24	33	18.4	34

How he goes when he releases tight / standard / wide of the middle stump (all release-tracked balls).

Angle	Balls	Tight	Standard	Wide
Over the wicket	67%	39%	60%	1%
Round the wicket	33%	0%	0%	100%

His crease-position mix, split by over vs round. Release data is modern-era (2017+); percentiles vs same hand + type.

Where he lets the ball go — lateral position × height (purple density). Over and round labelled; dotted lines mark tight/standard/wide and the return creases.

Movement (vs the average pace bowler · vs left-handers)

A hit-the-deck bowler who bangs it into a hard length for steep bounce and seams it around.

Generates above avg seam and about average swing for a pace bowler; seams it away more to left-hand batters (56%).

Swing by ball age to left-hand batters: new ball (≤25 ov, n=227) 37% away / 63% in; old ball (≥40 ov, n=346) 31% away / 69% in.

Percentile vs all Test pace bowlers; direction is which way it moves to this batter. Bounce = extra bounce vs expected.

Movement	Avg	vs average	Direction (vs left-handers)
Swing	0.78°	43rd pct (about average)	34% away / 66% in
Seam	0.60°	61st pct (above avg)	56% away / 44% in
Bounce	4.2°	66th pct (above avg)	—

Beaten — Grid

Length × line where he beats the bat — exact counts per cell.

Beaten — Heatmap

The same play-and-miss density, smoothed, with pitch markings.

Beats the bat most at **Good Length / Wide of 6th** (21% of play-and-misses). Overall he beats the bat 10.2% of tracked balls (false-shot 21.6%, n=1,139).

Test-match career data. Beaten/false-shot use ~38% shot-quality tracking; turn/drift ~30% ball-tracking. Catches split by fielding position (DeliveryFielders view); some catches have no recorded position. Danger zones use empirical-Bayes shrinkage (≥3 wkts to qualify).
