Scouting Summary

COMMON THEMES

- Left Orthodox, averaging 84.2 kph (up to 90.1).
- Typical length is **4-5m** (their good length); median 3.8 m.
- Stock ball is **full outside off, turning in, drifting away, hitting the top of off** (32% of deliveries).
- Goes round the wicket 45% of the time against left-handers.
- Round the wicket** he shifts his pitching line from wide of 6th to stumps.
- Turns it 4.3° on average; 34% of balls turn ≥5°.

BIGGEST THREATS

- Most dangerous length is **Full** (10 wkts, 5.3% adjusted strike).
- Danger pitching line: **Stumps**.
- Takes 25% of wickets pitching **full in the 4th-stump channel**.
- Beats the bat 2.4% of tracked balls (false-shot 17.5%).
- Most likely to dismiss you **caught** (58% of wickets).
- 29% of catches are behind the wicket (keeper / slips / gully); most often to long off: regulation, fine leg: leg slip, square leg: short leg.
- Very repeatable with his length — using your feet to change his length is more effective than waiting for a loose ball.

AREAS TO EXPLOIT

- Concedes most runs pitching **full on the 6th stump** (17% of runs).
- Away from full, the wicket threat drops off — look to score in the less-productive lengths.
- Most of his runs leak square/through the off side (43%) — his main scoring release.
- Cash in when he goes **full wide outside off** (economy 4.2, beats the bat only 16%).

Repeatability
P81

±0.9 m · vs spin bowlers

Percentile within same-type peers (grey = the peer distribution, line = this bowler). Release/crease vs hand × pace/spin; movement/speed/repeatability vs pace/spin. Release & speed are modern-era (2017+ / partial). **Crease variation** = how much he moves his release point sideways across the crease from ball to ball (within his main angle): a high percentile = he varies where he lets the ball go a lot, a low percentile = he releases from the same spot every ball. **Repeatability** = length consistency over his stock-length band (2–11 m, so deliberate yorkers and bouncers don't count as poor control): a high percentile = tighter, more metronomic lengths than peers; a low percentile = he varies his length more. A marker at the very edge = he sits beyond the typical peer range on that trait.

He's striking more often right now (avg 20 in his last 5 Tests vs 26 career).

Window	Balls	Wkts	Avg	Econ	SR	False%	Avg speed	Avg length

How he gets you out	His %	Base	Index
Caught	58%	59%	0.99×
LBW	17%	20%	0.84×
Bowled	17%	17%	0.99×

Share of his 12 wickets by type, indexed against the base rate vs the average spin bowler to LHB (men's Tests). **Index** >1 = he does it more than most, <1 = less. Caught is high for everyone — the signal is the over-indexed row.

Catches to: [Long off: regulation 1](#) [Fine leg: leg slip 1](#) [Square leg: short leg 1](#)

[Bowler 1](#) [Midwicket: deep 1](#) [Third man: short 1](#)

Angle & variations: Uses round the wicket to both (LHB 45% · RHB 93%)

Stock Ball & Ball Types (vs left-handers) [▶ watch stock balls](#)

Stock ball — full outside off, turning in, drifting away, hitting the top of off (32% of deliveries, economy 3.60). Minor variations: full on the stumps (16%) and full wide outside off (15%).

Ball type (pitch length × pitching line)	Movement	%	Econ	Wkts	Beaten %
full outside off ▶	turning in, drifting away	32%	3.60	2	21%
full on the stumps ▶	turning in, drifting away	16%	2.77	3	8%
full wide outside off ▶	turning in, drifting away	15%	4.22	1	16%
full in the channel ▶	turning in, drifting away	9%	3.13	3	17%
a good length wide outside off ▶	turning in, drifting away	8%	6.32	1	26%
a good length outside off ▶	turning in, drifting away	8%	4.42	0	21%

Ball type = pitch-length band × pitching-line region. **Movement** = swing in the air + seam/turn off the pitch, whichever is material, dominant first (ball-tracking, tracked balls only; blank if too few). **Beaten %** = false-shot rate on tracked balls. The stock-ball line above also notes where it passes the stumps.

New ball vs old ball

Old ball (31+ ov) · 230 balls · 10 wkts · econ 4.46

Top ball type	%	Econ	Wkts
full outside off	40%	3.22	2
full wide outside off	19%	4.88	1
a good length wide outside off	11%	6.33	1
a good length outside off	10%	3.18	0

How his ball types and threat shift with ball age (split at 30 overs). Empty side = too few balls in that phase.

Danger Zones (vs left-handers) [▶ watch danger balls](#)

WICKETS — WHERE MOST COME FROM
Full in the 4th-stump channel
25% of mapped wickets (3 of 12)

RUNS — WHERE MOST CONCEDED
Full on the 6th stump
17% of runs (27 of 160)

DANGER LINE
Stumps
3 wkts / 146 balls · 2.6% adj (2.1% raw) · low sample

DANGER LENGTH
Full
10 wkts / 181 balls · 5.3% adj (5.5% raw)

MOST LETHAL ZONE (BY RATE)
Full / Stumps
3 wkts / 39 balls · 5.8% adj (7.7% raw) · low sample

Most threatening pitching full on the stumps (10 wkts, 5.3% strike). Most wickets come from full in the 4th-stump channel, while he leaks the most runs full on the 6th stump.

Match-ups (vs left-handers)

New ball vs old ball

Split	Balls	Wkts	Avg	Econ	SR	False%	Med length
Old ball (31+ ov)	230	10	17.1	4.46	23.0	17%	4.23 m

By batting position

Split	Balls	Wkts	Avg	Econ	SR	False%	Med length
Middle (4–7)	167	5	32.8	5.89	33.4	14%	4.19 m

More yorkers/full at the tail (50%).

Lower average / higher false-shot = the match-up that suits him; higher average = where batters have got on top. Med length = his median pitch length in that split

Scoring Profile (vs left-handers)

59% of his runs come in boundaries — a boundary every 10 balls; most runs go to the off side (43%); the sweep hurts most (11 fours/sixes at 2.7 runs/ball).

A 2x3 grid of statistics for the 2019/2020 season. Each cell contains a category name, a large percentage value, and a descriptive subtitle.

BOUNDARY % 59% runs in 4s/6s	ROTATED % 41% runs in 1s & 2s	BALLS / BOUNDARY 10
OFF SIDE % 43% of runs	LEG SIDE % 30% of runs	STRAIGHT % 27% down the ground

Shot type	Balls	Runs	% runs	4s/6s	Runs/ball
Sweep	23	61	29%	11	2.65
Drive	22	56	26%	10	2.55
Work/Nudge	46	47	22%	0	1.02
Slog	8	29	14%	4	3.62

Direction from ball-tracking (all scoring shots); shot type recorded on 87% of scoring balls (109/125) — groups with <5 balls omitted.

Pitch Maps & Scoring

At the Stumps (wickets)

Wicket balls pass the stumps mostly at stumps — pitches around 4th stump and moves it back.

Where They're Scored Off

Runs come mostly on the off side (62%).

Where They Pitch It

Pitches it full on the 6th stump most often (16%); rarely drops short (0%).

Where Wickets Come From

Wickets come mostly from balls pitched full in the 4th-stump channel, but strikes most often pitching on the stumps.

Speed & Spells

He drops ~1.6 km/h from his opening spell to later spells, keeps his pace into the 2nd innings, and is as quick on the final day as day one.

Speed by Spell

By spell — opening burst vs later spells.

Speed by Innings

1st vs 2nd innings of the match.

Speed by Day

By match day — fatigue across the game.

Over vs Round the Wicket (vs left-handers)

Round the wicket his pitching line moves from wide of 6th to stumps — economy 4.15→4.78, a wicket every 31→26 balls (over→round).

Angle	Balls	Pitch line	Length	Short %	Econ	Wkts	Bdry %
Over	185 (55%)	Wide of 6th	4.2 m	0%	4.15	6	61%
Round	153 (45%)	Stumps	4.3 m	0%	4.78	6	57%

Over the Wicket

Where he pitches it from over the wicket (185 balls).

Round the Wicket

Where he pitches it from round the wicket (153 balls).

Sequencing & Over Construction

Relentlessly consistent — repeats his length ball after ball (length spread ± 1.0 m; more repeatable than 81% of spin bowlers); holds a steady length right through the over; and holds the same crease position through the over.

Across 16 dismissals, the wicket ball lands about 33 cm fuller than the ball before it — that's the change that brings the wicket.

Ball in over	Median length	Short %	Econ	Wkt %
Ball 1	4.2 m	0%	5.80	1.7%
Ball 2	4.2 m	0%	5.30	1.7%
Ball 3	4.4 m	0%	3.50	5.0%
Ball 4	4.2 m	0%	5.31	1.9%
Ball 5	4.3 m	0%	3.00	5.8%
Ball 6	4.2 m	0%	3.17	5.7%

Length spread = std-dev of pitch length (smaller = more repeatable). The table shows how his length, scoring and wicket rate shift across the six balls of an over. Set-up lines compare each ball with the previous delivery in the same over (career, all batters).

Release Point & Crease Use

A high release point (taller than 84% of left-arm spin); releases tight to the stumps (59 cm out, tighter than 88% of left-arm spin); varies his spot on the crease a lot (more than 98% of left-arm spin).

Crease position	% balls	Balls	Econ	Wkts	Avg	SR
Standard (45–75)	28%	208	3.49	6	20.2	35
Wide (>75cm)	72%	541	3.46	13	24.0	42

How he goes when he releases tight / standard / wide of the middle stump (all release-tracked balls).

Angle	Balls	Tight	Standard	Wide
Over the wicket	26%	2%	93%	6%
Round the wicket	74%	0%	5%	95%

His crease-position mix, split by over vs round. Release data is modern-era (2017+); percentiles vs same hand + type.

Where he lets the ball go — lateral position × height (purple density). Over and round labelled; dotted lines mark tight/standard/wide and the return creases.

Movement (vs the average spin bowler · vs left-handers)

A big turner of the ball.

Generates well above avg turn and about average drift for a spin bowler; turns it in more to left-hand batters (99%).

Percentile vs all Test spin bowlers; direction is which way it moves to this batter. Bounce = extra bounce vs expected.

Movement	Avg	vs average	Direction (vs left-handers)
Drift	1.60°	45th pct (about average)	100% away / 0% in
Turn	4.49°	82nd pct (well above avg)	1% away / 99% in
Bounce	4.1°	30th pct (below avg)	—

Beaten — Grid

Length × line where he beats the bat — exact counts per cell.

Beaten — Heatmap

The same play-and-miss density, smoothed, with pitch markings.

Beats the bat most at **Good Length / Wide of 6th** (40% of play-and-misses). Overall he beats the bat 2.4% of tracked balls (false-shot 17.5%, n=338).

Test-match career data. Beaten/false-shot use ~38% shot-quality tracking; turn/drift ~30% ball-tracking. Catches split by fielding position (DeliveryFielders view); some catches have no recorded position. Danger zones use empirical-Bayes shrinkage (≥3 wkts to qualify).
